Know Your Tick Facts

American Dog Tick	Dermacentor variabilis	Ornithodoros	Soft Ticks
The American dog tick can transmit Rocky Mountain spotted fever, <i>Tularemia</i> , <i>Ehrlichia</i> , <i>Anaplasma</i> , and tick paralysis.		Soft ticks do not have the hard shell and are shaped like a large raisin. Soft ticks carry tick relapsing fever.	
lxodes pacificus	Western Black Legged Tick	lxodes scapularis	Deer Tick
	The western black legged tick is most prevalent along the West Coast where it transmits Lyme disease and granulocytic anaplasmosis. It also is suspected of transmitting Bartonella and Babesia to people.	The state of the s	The deer tick is prevalent on east coast and transmits Lyme disease, Ehrlichia, Anaplasma, Babesia and Rickettsia. It carries Bartonella but transmission to humans has not yet been proven.
Brown Dog Tick	Rhipicephalus sanguineus	Rocky Mtn Wood Tick	Dermacentor andersoni
The brown dog tick carries Q fever, Rocky Mountain spotted fever and other Rickettsia, Ehrlichia, Babesia, Bartonella.	The state of the s	The Rocky Mountain wood tick transmits <i>Tularemia</i> , tick paralysis, Rocky Mountain spotted fever, Q fever, and Colorado tick fever.	
Identifying features on Pacific Coast Tick Dermacentor occidentalis		Lone Star Tick	Amblyomma americanum
PALPUS BASIS CAPITULI EYE DORSAL SHIELD LEG FESTOONS		The lone star tick is prevalent in the Southwest and can transmit <i>Rickettsia</i> , <i>Tularemia</i> , <i>Ehrlichia</i> , Q fever and tick paralysis as well as <i>Borrelia lonestari</i> , which causes "STARI," an illness almost identical to Lyme.	
The Pacific coast tick is prevalent in the West and Southwest. It can transmit Colorado tick fever virus, the <i>Rickettsia</i> of Q Fever and spotted fever as well as the bacterium that causes <i>Tularemia</i> . It is known to cause tick paralysis in cattle, horses and deer. Bite wounds are commonly mistaken for wounds caused by biting insects and spiders.		The species of bacteria among the tick-borne pathogens are diverse. This complicates diagnosis because current antibody tests are species-specific. Fifteen tick-borne bacterial pathogens have been identified worldwide, including 3 species of <i>Ehrlichia</i> , and 4 or 5 of <i>B. burgdorferi</i> . Scientists have not identified all of the pathogens that ticks may carry.
